

## HEALTHCONNECT — WEEK 7

### Issue Resolution Status

#### Resolved / validated

- Ratio anomaly — preprocessing cap applied and retest passed with maximum ratio 1.000.
- Reminder-channel missing/encoding issue — explicit None / No Reminder handling applied and filter stability retested.
- Cancelled-appointment DAX denominator issue — explicit exclusion applied and retest reached 61.76%.
- ML invalid-input validation — invalid numeric inputs were rejected correctly; valid-input regression remained successful.
- Missing required field validation — incomplete input was correctly rejected.
- Distance missingness in Data Science handoff — distance\_missing indicator added and corrected handoff retested.

#### Open / pending

- ML flagged-count logging discrepancy.
- Operational validation of the configurable risk threshold.
- Confirmation that the corrected Data Science handoff is the adopted Week 8 version.
- Reminder-timing data unavailable.
- Low-confidence 0–7 days  $\times$  3+ prior no-shows interaction (n=13).
- Final predicted probability outputs required for Power BI risk filtering.

#### PM conclusion

Week 7 has produced meaningful technical validation and refinements. The remaining items are explicitly controlled as open issues or Week 8 dependencies rather than being presented as completed.
